Heterogeneity, financial markets, and macroeconomic fluctuations

Rohan Kekre
Chicago Booth and NBER

August 2022
The core idea and research questions

- Households, institutions, countries differ in financial portfolios.
- Shocks affect asset prices and thus redistribute wealth.
- If those who gain wish to hold a different portfolio on the margin than those who lose, this will induce financial flows.
- This further changes asset prices and (maybe) real activity.
The core idea and research questions

- Households, institutions, countries differ in financial portfolios.
- Shocks affect asset prices and thus redistribute wealth.
- If those who gain wish to hold a different portfolio on the margin than those who lose, this will induce financial flows.
- This further changes asset prices and (maybe) real activity.

- To what extent does this account for
  - *comovement* between asset prices, risk premia, real economy?
  - *amplification* of asset prices and risk premia vs. real economy?
Overview of papers covered today

• Will focus on transmission of *monetary shocks* today.

• Three papers (with Moritz Lenel):

  1. *Monetary policy, redistribution, and risk premia* (ECMA).
     Effects on equity premium and feedback to real economy.

  2. *The flight to safety and international risk sharing* (WP).
     Asymmetric effects in “Global Financial Cycle”.

     Effects on term premium.

• Core ideas extend beyond monetary shocks.
  Will discuss this and other open questions at end.
Related literatures (not exhaustive)

- **Asset pricing:**
  - Heterogeneous agents and risk-sharing: Constantinides-Duffie (96), Garleanu-Panageas (15), Gourinchas-Rey-Govillot (17), Maggiori (17).
  - Asset demands and flows: Duffie (10), Chien-Cole-Lustig (12), He-Krishnamurthy (13), Vayanos-Vila (21), Gabaix-Koijen (22).
  - Here: production economies, wealth revaluation induces flows.

- **Macroeconomics:**
  - “HANK” models: Kaplan-Moll-Violante (18), Auclert (19).
  - Here: risk premia (not agency/liquidity), mprs not mpcs.

- **Interactions:** Alvarez-Atkeson-Kehoe (02,09), Brunnermeier-Sannikov (14), Gabaix-Maggiori (15), Caballero-Simsek (20), Itskhoki-Mukhin (21).
Plan

1. Introduction

2. Evidence on monetary policy and asset prices

3. Monetary policy and the equity premium

4. Monetary asymmetries in the Global Financial Cycle

5. Monetary policy and the term premium

6. Taking stock and open questions
Evidence on monetary policy and asset prices

• Large and growing body of evidence that expansionary MP shocks raise the price of risky financial assets and lower future excess returns — i.e., expansionary MP lowers risk premia.

• Equity premium: Bernanke-Kuttner (05), ...

• External finance premium: Gertler-Karadi (15), ...

• Term premium: Hanson-Stein (15), ...

• Disproportionate effects of U.S. monetary shocks: Rey (13), ...

• Review selected empirical evidence from my work here.
Monetary policy and equity premium (1/2)

- Bernanke-Kuttner (05) meets Gertler-Karadi (15).
- Monthly VAR, 7/79-6/12.
- IV: Fed Funds futures surprises on FOMC days, 1/91-6/12.
• Following Campbell-Shiller (88):

\[
(\text{real stock return})_t - \mathbb{E}_{t-1}[\text{(real stock return)}_t] = (\mathbb{E}_t - \mathbb{E}_{t-1}) \sum_{j=0}^{\infty} \kappa^j \Delta(\text{dividends})_{t+j} - (\mathbb{E}_t - \mathbb{E}_{t-1}) \sum_{j=1}^{\infty} \kappa^j (\text{real rate})_{t+j} - (\mathbb{E}_t - \mathbb{E}_{t-1}) \sum_{j=1}^{\infty} \kappa^j (\text{excess return})_{t+j}.
\]

• U.S. easing lowers risk premia by more than easing abroad, a key element of “Global Financial Cycle” (Rey (13,16), ...).
Monetary policy and term premium

- Campbell-Shiller decompositions sensitive to VAR and $\kappa$.
- Following Hanson-Stein (15), real term structure is nice since

$$df_{t}^{(\tau-1, \tau)} = dE_{t}r_{t+\tau-1} + d[risk\ premium]_{t}^{\tau}$$

and MP shocks (likely) have no effect on long-run real rates.
Monetary policy and term premium

- Campbell-Shiller decompositions sensitive to VAR and $\kappa$.

- Following Hanson-Stein (15), real term structure is nice since

$$df_t^{(\tau-1,\tau)} = dE_t r_{t+\tau-1} + d[risk\ premium]_t$$

and MP shocks (likely) have no effect on long-run real rates.

- Taking stock: (U.S.) MP easing lowers risk premia. Why?
Plan

1. Introduction

2. Evidence on monetary policy and asset prices

3. Monetary policy and the equity premium

4. Monetary asymmetries in the Global Financial Cycle

5. Monetary policy and the term premium

6. Taking stock and open questions
Monetary policy, redistribution, and risk premia

• Environment:
  • standard New Keynesian model with capital and nom. bonds +
  • heterogeneous agents differing in risk tolerance.

• Findings:
  • Expansionary MP redistributes to relatively risk tolerant, who
    are levered, by devaluing debt, raising profits, and raising $q$.
  • Since these agents have a high
    \[
    \frac{\text{marginal propensity to save in capital}}{\text{marginal propensity to save}} \equiv mpr,
    \]
    this lowers risk premium on capital.
  • Conditional on safe rate, this stimulates $x$, $c$, and $y$.
  • Calibration to SCF rationalizes Campbell-Shiller decomposition
    after MP shock and amplifies stimulus by $1.3 - 1.4$ times.
Two-period model (1/2)

- Two-period model before quantifying in richer $\infty$-horizon.
Two-period model (1/2)

• Two-period model before quantifying in richer $\infty$-horizon.

• Continuum of households with

$$\log v^i_0 = (1 - \beta) \log c^i_0 - \bar{\theta} \frac{\ell^0_0^{1+1/\theta}}{1 + 1/\theta} + \beta \log \left( \mathbb{E}_0 \left[ (c^i_1)^{1-\gamma^i} \right] \right)^{\frac{1}{1-\gamma^i}}.$$

• Resource constraints:

$$P_0 c^i_0 + B^i_0 + Q_0 k^i_0 \leq W_0 \ell_0 + (1 + i_{-1}) B^i_{-1} + (\Pi_0 + (1 - \delta_0) Q_0) k^i_{-1},$$

$$P_1 c^i_1 \leq (1 + i_0) B^i_0 + \Pi_1 k^i_0.$$

• Workers supply identical $\ell_0$ at rigid wages $W_0 = W_{-1}$. 
Two-period model (2/2)

- Representative firm:
  \[ \Pi_0 k_{-1} = P_0 \ell_0^{1-\alpha} k_{-1}^\alpha - W_0 \ell_0 + Q_0 x_0 - P_0 \left( \frac{k_0}{k_{-1}} \right)^{\chi^x} x_0, \]
  \[ \Pi_1 k_0 = P_1 \exp(\epsilon_1^z) k_0^\alpha. \]

- Aggregate risk: \( \epsilon_1^z \sim N \left( -\frac{1}{2} \sigma^2, \sigma^2 \right). \)

- Monetary policy: \( 1 + i_0 = (1 + \bar{i}) \left( \frac{P_0}{P_{-1}} \right)^{\phi} \exp(\epsilon_0^m), P_1 = P_0. \)

- Market clearing: goods, labor, capital, bonds.
Two-period model (2/2)

- Representative firm:
  \[ \Pi_0 k_{-1} = P_0 \ell_0^{1-\alpha} k_{-1}^\alpha - W_0 \ell_0 + Q_0 x_0 - P_0 \left( \frac{k_0}{k_{-1}} \right)^{x^x} x_0, \]
  \[ \Pi_1 k_0 = P_1 \exp (\epsilon_1^z) k_0^\alpha. \]

- Aggregate risk: \( \epsilon_1^z \sim N \left( -\frac{1}{2} \sigma^2, \sigma^2 \right). \)

- Monetary policy: \( 1 + i_0 = (1 + \bar{i}) \left( \frac{P_0}{P_{-1}} \right)^\phi \exp (\epsilon_0^m), P_1 = P_0. \)

- Market clearing: goods, labor, capital, bonds.

- How does \( \epsilon_0^m \) affect risk premium on capital?

- What are implications for real transmission?
Micro-level optimization

- Optimal consumption and savings are

\[ c^i_0 = (1 - \beta) \left[ w_0 \ell_0 + (1 + i_{-1}) \frac{B^i_{-1}}{P_0} + (\pi_0 + (1 - \delta_0)q_0)k^{i}_{-1} \right], \]

\[ a^i_0 \equiv b^i_0 + q_0 k^i_0 = \beta \left[ w_0 \ell_0 + (1 + i_{-1}) \frac{B^i_{-1}}{P_0} + (\pi_0 + (1 - \delta_0)q_0)k^{i}_{-1} \right]. \]

- Optimal portfolio share in capital \( \omega^i_0 \equiv q_0 k^i_0 / a^i_0 \) implicitly defined by

\[ \mathbb{E}_0 \left( c^i_1 \right)^{-\gamma^i} (\exp r^k_1 - \exp r_1) = 0, \]

given

\[ r^k_1 \equiv \log \pi_1 / q_0, \]
\[ r_1 \equiv \log(1 + i_0)(P_0 / P_1) = \log(1 + i_0). \]
Monetary policy and the risk premium (1/2)

- Second-order approximation of optimal portfolio choice condition around $r^k_1 = r_1 \Rightarrow$

\[
\mathbb{E}_0 r^k_1 - r_1 + \frac{1}{2} \sigma^2 \approx \gamma^i \omega^i_0 \sigma^2,
\]

or equivalently

\[
\omega^i_0 \approx \frac{1}{\gamma^i} \frac{\mathbb{E}_0 r^k_1 - r_1 + \frac{1}{2} \sigma^2}{\sigma^2}.
\]
Monetary policy and the risk premium (1/2)

- Second-order approximation of optimal portfolio choice condition around $r^k_1 = r_1 \Rightarrow$

\[
\mathbb{E}_0 r^k_1 - r_1 + \frac{1}{2} \sigma^2 \approx \gamma^i \omega^i_0 \sigma^2,
\]

or equivalently

\[
\omega^i_0 \approx \frac{1}{\gamma^i} \frac{\mathbb{E}_0 r^k_1 - r_1 + \frac{1}{2} \sigma^2}{\sigma^2}.
\]

- Asset market clearing requires

\[
\int_0^1 a^i_0 \omega^i_0 \, di = q_0 k_0,
\]

\[
\int_0^1 a^i_0 (1 - \omega^i_0) \, di = 0.
\]
Monetary policy and the risk premium (2/2)

**Proposition**

The risk premium on capital is

\[ E_0 r^k_1 - r_1 + \frac{1}{2} \sigma^2 \approx \gamma \sigma^2, \]

where \( \gamma = \left( \int \frac{a_i}{a_{i'}} \frac{1}{\gamma^l} \, di \right)^{-1}. \)
Monetary policy and the risk premium (2/2)

Proposition

The risk premium on capital is

$$E_0 r_1^k - r_1 + \frac{1}{2} \sigma^2 \approx \gamma \sigma^2,$$

where $$\gamma = \left( \int \frac{a_i^i}{\int a_0 i' d' i} \frac{1}{\gamma^i} d i \right)^{-1}.$$. In response to a monetary shock,

$$\frac{d}{d \epsilon_0 m} \left[ E_0 r_1^k - r_1 \right] = \gamma \sigma^2 \int \frac{d \left[ a_i^i / \int a_0^i d' i' \right]}{d \epsilon_0 m} (1 - \omega_0^i) d i.$$
Proposition

The risk premium on capital is

$$\mathbb{E}_0 r_1^k - r_1 + \frac{1}{2}\sigma^2 \approx \gamma \sigma^2,$$

where

$$\gamma = \left( \int \frac{a_i^0}{\int a_i^0 di'} \frac{1}{\gamma^i} di \right)^{-1}.$$

In response to a monetary shock,

$$\frac{d}{d\epsilon^m_0} \left[ \mathbb{E}_0 r_1^k - r_1 \right] = \gamma \sigma^2 \int \frac{d}{d\epsilon^m_0} \left[ \frac{a_i^0}{\int a_i^0 di'} \right] (1 - \omega_i^0) di.$$

- Policy affects the risk premium (only) by redistributing wealth.
- Redistribution to agents with high $\omega_i^0$ lowers risk premium.
Risk premium and the real economy (1/2)

• By definition of equilibrium profits,

\[ E_0 r_1^k = E_0 \log \pi_1 - \log q_0 = (\alpha - 1) \log k_0 - \log q_0. \]

• By optimal investment,

\[ \log q_0 = \chi^x (\log k_0 - \log k_{-1}). \]

• Combining,

\[ d \left[ E_0 r_1^k - r_1 \right] = - (1 - \alpha + \chi^x) d \log k_0 - dr_1. \]

• Thus, fall in risk premium \( \iff \) rise in capital accumulation, conditional on \( r_1 \).
Risk premium and the real economy (2/2)

- Rise in investment and $q_0$ stimulate agg consumption $c_0$:

$$c_0 = (1 - \beta) [y_0 + (1 - \delta_0)q_0 k_{-1}].$$

- ...and both the stimulus to investment and consumption stimulate output:

$$c_0 + (k_0 - (1 - \delta_0)k_{-1}) = y_0.$$

- Appl’n of logic in Caballero-Farhi (18), Caballero-Simsek (20).
Sources of redistribution

- So far:
  - monetary easing lowers risk premium if redistributes to high $\omega_i^0$,
  - amplifying real transmission, conditional on real rate.
Sources of redistribution

- So far:
  - monetary easing lowers risk premium if redistributes to high $\omega^i_0$,
  - amplifying real transmission, conditional on real rate.

- Define $n^i_0 \equiv w_0 \ell_0 + (1 + i_{-1}) \frac{B^i_{-1}}{P_0} + (\pi_0 + (1 - \delta_0)q_0)k^i_{-1}$,
  $n_0 \equiv \int n^i_0 di$.

- On impact of a monetary shock:

$$d \left[ \frac{n^i_0}{n_0} \right] = \frac{1}{n_0} \left[ -\frac{1 + i_{-1}}{P_0} B^i_{-1} d \log P_0 + \right.$$ 

$$\left. \left( k^i_{-1} - \frac{n^i_0}{n_0} k_{-1} \right) (d\pi_0 + (1 - \delta_0)dq_0) \right].$$

- à la Auclert [19], but what matters is covariance with $\omega^i_0$. 
Putting it all together

Proposition

Suppose agents differ in $\gamma^i$, their endowments are consistent with period 0 choices ($\omega^i_{t-1} = \omega^i_0$), and they have same initial $n^i_0$. Then:

- cut in nominal rate lowers risk premium, and
- stimulus to $\{k_0, c_0, y_0\}$ are larger than RANK starting from same aggregate allocation.

- Risk tolerant agents borrow in nominal bonds to hold capital.
- Lower nominal rate redistribute to them via $P_0$, $\pi_0$, and $q_0$.
- As they rebalance to capital, risk premium falls + output rises.
Generalizations

- Results do not rely on heterogeneity in risk aversion.
Generalizations

• In each case, relatively levered agents will invest more in capital given a marginal dollar in income.
Exposures and the MPR

- **Marginal propensity to take risk** ($mpr$) formalizes this.
Exposures and the MPR

- Marginal propensity to take risk (mpr) formalizes this.

- Micro optimization: $k^i_0(n^i_0; \cdot)$, $b^i_0(n^i_0; \cdot)$, $a^i_0(n^i_0; \cdot)$, $c^i_0(n^i_0; \cdot)$. 
Exposures and the MPR

- **Marginal propensity to take risk** \((mpr)\) formalizes this.

- Micro optimization: \(k_0^i(n_0^i; \cdot), b_0^i(n_0^i; \cdot), a_0^i(n_0^i; \cdot), c_0^i(n_0^i; \cdot)\).

- \(mpr_0^i \equiv q_0 \frac{\partial k_0^i}{\partial n_0^i} / \frac{\partial a_0^i}{\partial n_0^i}\).
Exposures and the MPR

- **Marginal propensity to take risk** \((mpr)\) formalizes this.
- Micro optimization: \(k^i_0(n^i_0; \cdot), b^i_0(n^i_0; \cdot), a^i_0(n^i_0; \cdot), c^i_0(n^i_0; \cdot)\).

\[
mpr^i_0 \equiv q_0 \frac{\partial k^i_0}{\partial n^i_0} / \frac{\partial a^i_0}{\partial n^i_0}.
\]

- So far, \(mpr^i_0 = \omega^i_0\) (because IES = 1, \(c^i_1 = \) portfolio returns).
Exposures and the MPR

• **Marginal propensity to take risk** (*mpr*) formalizes this.

• Micro optimization: \(k_0^i(n_0^i; \cdot), b_0^i(n_0^i; \cdot), a_0^i(n_0^i; \cdot), c_0^i(n_0^i; \cdot)\).

• \(mpr_0^i \equiv q_0 \frac{\partial k_0^i}{\partial n_0^i} / \frac{\partial a_0^i}{\partial n_0^i}\).

• So far, \(mpr_0^i = \omega_0^i\) (because IES = 1, \(c_1^i = \) portfolio returns).

• But more generally, \(mpr_0^i \neq \omega_0^i\).
Exposures and the MPR

- **Marginal propensity to take risk** \((mpr)\) formalizes this.

- Micro optimization: \(k_0^i(n_0^i; \cdot), b_0^i(n_0^i; \cdot), a_0^i(n_0^i; \cdot), c_0^i(n_0^i; \cdot)\).

- \(mpr_0^i \equiv q_0 \frac{\partial k_0^i}{\partial n_0^i} / \frac{\partial a_0^i}{\partial n_0^i}\).

- So far, \(mpr_0^i = \omega_0^i\) (because IES = 1, \(c_1^i = \) portfolio returns).

- But more generally, \(mpr_0^i \neq \omega_0^i\). In limit as \(\sigma \to 0\),

\[
\overline{mpr}_0^i = \frac{\overline{\gamma}}{\gamma^i},
\]

\[
\overline{\omega}_0^i = \left(\frac{\overline{c}_1^i}{(1 + \overline{r}_1)\overline{a}_0^i}\right) \frac{\overline{\gamma}}{\gamma^i} - \frac{\overline{w}_1}{(1 + \overline{r}_1)\overline{a}_0^i}.
\]
Monetary policy and the risk premium, redux

Proposition

Up to third order in \( \{\sigma, \epsilon_1^Z, \epsilon_0^m\} \),

\[
\mathbb{E}_0 r_1^k - r_1 + \frac{1}{2} \sigma^2 = \tilde{\gamma} \sigma^2 + \bar{\gamma} \int \frac{dc_1^i}{c_1'} \left[ \int c_1'' d\epsilon_0^m \right] (1 - \overline{mpr}_0^i) \epsilon_0^m \sigma^2 + o(||\cdot||^4).
\]
Monetary policy and the risk premium, redux

Proposition

Up to third order in \( \{\sigma, \epsilon^Z_1, \epsilon^m_0\} \),

\[
\mathbb{E}_0 r^k_1 - r_1 + \frac{1}{2} \sigma^2 = \bar{\gamma} \sigma^2 + \bar{\gamma} \int \frac{d \left[ c'_1 / \int c'_1 di' \right]}{d \epsilon^m_0} (1 - \text{mpr}_i^0) \epsilon^m_0 \sigma^2 + o(||\cdot||^4).
\]

- Monetary easing lowers risk premium if it redistributes to agents with high mprs.
- Decouples and clarifies roles of portfolios and mprs:
  - Portfolios govern change in wealth due to MP shock.
  - mprs describe how agents respond to change in wealth.
Extending the model to the infinite horizon

1. Labor supply with Rotemberg (82) wage adj. costs.

2. Three types \( i \in \{a, b, c\} \), within which identical preferences.
   - Technical trick: trade \( \ell \) endowment within types to aggregate.

3. Lower bound on capital \( k \).

4. Prod. shocks feature rare disaster with time-varying prob.

5. Global solution, given state variables

\[
\begin{aligned}
\{ m_t, p_t, k_{t-1}/(z_{t-1} \exp(\epsilon^z_t)), w_{t-1}/(z_{t-1} \exp(\epsilon^z_t)), s_t^a, s_t^c \}.
\end{aligned}
\]
Brief interlude on computation

- Codes available at https://github.com/KekreLenel.

- General structure:
  1. Use FOCs and market clearing to solve for policies given guessed state transitions and policies tomorrow.
  2. Solve for state transitions implied by new policies.
  3. Update guesses and return to step 1.

- Key features for speed and accuracy:
  - Sparse Smolyak grids, Chebyshev interpolation, parallelization.
  - Decouple portfolio choice from consumption/savings:
    - Each iteration, solve for optimal portfolio choice and \( r \) which equilibrates bond market, given guessed total savings.
    - Over iterations, slowly update total savings and \( q \) consistent with consumption/savings decision and capital accumulation.
Micro moments from the SCF

- Decompose $A^i$ into $\{Q^k_i, B^i\}$ s.t. $B^i + Q^k_i = A^i$.

- If household $i$ holds $1$ equity in a firm with $\frac{\text{capital}}{\text{equity}} = lev_{firm}$, assign $\{Q^k_i = lev_{firm}, B^i = 1 - lev_{firm}\}$. 
Micro moments from the SCF

- Decompose $A^i$ into $\{Qk^i, B^i\}$ s.t. $B^i + Qk^i = A^i$.

- If household $i$ holds $1$ equity in a firm with $\frac{\text{capital}}{\text{equity}} = \text{lev}_{\text{firm}}$, assign $\{Qk^i = \text{lev}_{\text{firm}}, B^i = 1 - \text{lev}_{\text{firm}}\}$.

The flight to safety and international risk sharing

• Two-country generalization of environment in previous paper.

• New mechanism: exchange rates also redistribute wealth.

• If USD appreciates in bad times, relatively risk tolerant will insure risk averse by borrowing in USD-denominated bonds.

• Implications:
  • U.S. MP easing depreciates USD ⇒ redistribute to risk tol.
  • Foreign easing appreciates USD ⇒ redistribute from risk tol.

• But why does USD appreciate in bad times (as in data)?
  • Flight to safe, dollar-denominated assets (Treasuries).
  • What most of paper is about.
## Effects of monetary shocks in data and model

- Small fraction active traders amplifies effect because this implies little risk-bearing capital available to absorb flows. (Duffie (10), Chien-Cole-Lustig (12), Gabaix-Koijen (22), ...)

⇒ Both “income elasticities” and “price elasticities” matter.
Plan

1. Introduction
2. Evidence on monetary policy and asset prices
3. Monetary policy and the equity premium
4. Monetary asymmetries in the Global Financial Cycle
5. Monetary policy and the term premium
6. Taking stock and open questions
Monetary policy, segmentation, and the term structure

• Study effects of monetary policy on real term premia in preferred habitat environment à la Vayanos-Vila (21).

• Preferred habitat model has two useful features:
  • Trade in bonds between habitat investors and arbitrageurs.
  • Both heterogeneous mprs and low “price elasticities”.

• Key ideas:
  • Vayanos-Vila (21) counterfactually implies a monetary easing raises term premia, as habitat investors borrow more long term.
  • CARA prefs ⇒ wealth of arbs irrelevant for term premia.
  • Relaxing this, wealth revaluation of arbs accounts for decline in term premia provided arbs have positive duration.
Effects of monetary shock in data and model

- Arb duration disciplined by high-freq. resp. of dealer equities.
- Model-implied response of forward rates consistent with data.
Plan

1. Introduction
2. Evidence on monetary policy and asset prices
3. Monetary policy and the equity premium
4. Monetary asymmetries in the Global Financial Cycle
5. Monetary policy and the term premium
6. Taking stock and open questions
Taking stock

- Households, institutions, countries differ in financial portfolios.
- Shocks affect asset prices and thus redistribute wealth.
- If those who gain wish to hold a different portfolio on the margin than those who lose, this will induce financial flows.
- This further changes asset prices and (maybe) real activity.
- Today: three papers with application to monetary shocks.
Open questions

• Measurement:
  - How do agents allocate wealth on margin? (mprs, not mpcs)
  - How much can this account for flow response to macro shocks?

• Positive questions:
  - Beyond monetary shocks, how much can this account for business cycle comovement? Amplification?

• Normative questions:
  - Redistribution affects asset prices and real activity. How should this inform optimal stabilization policy?
Open questions

• Measurement:
  • How do agents allocate wealth on margin? (mprs, not mpcs)
  • How much can this account for flow response to macro shocks?

• Positive questions:
  • Beyond monetary shocks, how much can this account for business cycle comovement? Amplification?

• Normative questions:
  • Redistribution affects asset prices and real activity. How should this inform optimal stabilization policy?

• Encourage you to explore these ideas, and excited to discuss!
